Formats AutoCAD supports four file formats: AutoCAD DWG—The original AutoCAD format. AutoCAD R13, commonly referred to as dxf—A format for providing and exchanging drawings in a Windows-based operating system environment. There are limitations that affect its use in situations that require the use of open source tools. (There are many reasons why open source or free software may not be able to support AutoCAD's dxf format; open source applications generally focus on the Linux and open source UNIX operating systems, while Autodesk supports both Windows and Linux platforms. DGN—An older format supported by some of AutoCAD's early applications. DXF—An AutoCAD format that is used in conjunction with the Windows operating system. MS DXF—This is a file type for importing and exporting with Microsoft Excel (often called OpenOffice.org or LibreOffice). Technical support can be given in English. Over the years, AutoCAD has introduced different ways of representing the same type of information in its different formats. For example, when a drawing is started, the DWG format displays an icon called the type of information. This icon will display information about the drawing, including the number of sheets, the number of layers, and the number of blocks. (See icon on top of preview window for information about the type of drawing.)
