Multiple reports have demonstrated that neural stem and progenitor cells (NPC) can survive in a range of stroke, neurodegenerative disease, spinal cord injury and traumatic brain injury (TBI) conditions. Substantial evidence also suggests that NPC can migrate and differentiate to replace lost neurons following injury, and restore motor and sensory function. However, these laboratory findings have not yet led to successful clinical trials of NPC transplantation. Differences in the developmental and behavioural characteristics of human and rodent studies are fundamental in understanding the utility and challenges of using human NPC in clinical studies. This review assesses the current status of NPC research in animal models of central nervous system (CNS) diseases in terms of clinical translation. Recent progress indicates that NPC are therapeutically effective in rodent models of CNS disorders with promising data. However, despite the efficacy and feasibility data, we must recognize that human NPC do not have the same in vivo pattern of migration and differentiation compared with rodent NPC, in addition to potential species-specific differences in the immune system. There is a need for further characterization and optimization of human NPC in vitro. The results of preclinical studies using human NPC are promising, but additional work is needed to enable the clinical development of NPC. The application of human NPC to clinical trials is now feasible and imminent.

"He was found immediately unconscious and they did have a number of efforts at resuscitation and a number of attempts to resuscitate and unfortunately they were not successful and he did pass away," London's chief medical examiner said at a news conference Monday evening. The man's family had not been informed of his death, but they have been informed that an autopsy
